

The iMix Onboard stereo mixer combines the award-winning iBeam and the high-performance Element in a drop-in upgrade that is designed to directly retrofit several factory-installed systems. This system also features a side-mounted battery-access preamp with EQ, volume, phase, stereo/mono and mix controls. Simply put, this is the complete package.

The iMix Onboard is engineered for guitarists that play in diverse situations and environments: the multiple-award-winning iBeam delivers fidelity comparable to the world's best studio microphones (see The iBeam Challenge), while the Element offers presence and snap to accommodate the demands stage use, such as cutting through a loud mix. The all-discrete class A preamp/EQ is built with quality components designed to naturally support the pickups' unique characteristics, and features an onboard control group that gives you the power to breathe even more life into your sound.

This system is an excellent choice for the player that wants everything: depth, warmth, clarity and body sensitivity; presence, snap and even string balance; and complete onboard customization controls. It is also a great choice for users seeking to replace their factory-installed system with no cutting or soldering.
